

Supplemental Material for “Proximal Methods for Sparse Optimal Scoring and Discriminant Analysis”

This document provides supplemental materials for the manuscript *Proximal Methods for Sparse Optimal Scoring and Discriminant Analysis*. Specifically, we provide detailed results for the numerical analysis provided in Section 3 of the manuscript. Table 1 provides average run-time, misclassification rate, and cardinality of classifiers for the classification trials described in Section 3.1 of the manuscript, while Tables 2, 3, 4, and 5 provide a summary of the data sets, misclassification rate, run-time, and cardinality of classifiers, respectively, for the analysis of the UC Riverside Time-Series repository described in Section 3.4.

Table 1: Experimental results for synthetic data. All results are listed in the format “mean (standard deviation)”. In all experiments, $n_{\text{train}} = 25K$ and $n_{\text{test}} = 250K$, with total number of predictor variables equal to $qp = 500(K - 1)$.

Experiment	Method	Misclassification Rate	Cardinality	Run-time (s)

Table 3: Misclassification rate for each classification heuristic for each data set in the UCR repository. We include SOS with accelerated proximal gradient (APG), alternating direction method of multipliers (ADMM), least angle regression (LARS), as well as sparse zero-variance discriminant analysis (SZVD), and nearest neighbour classifiers using Euclidean distance (ED), dynamic time warping distance with window width $w = 100$ (DTW), and dynamic time warping distance with learned window width (DTWL). The misclassification rates for the three nearest neighbour classifiers were provided by the UCR repository documentation. Trained window width for DTWL is given in parentheses. Misclassification rates are omitted for LARS for any data sets for which LARS failed to terminate within 11 days.

Table 5: Fraction of nonzero discriminant vector features for each classification heuristic for each data set in the UCR repository. We include SOS with accelerated proximal gradient (APG), alternating direction method of multipliers (ADMM), least angle regression (LARS), as well as sparse zero-variance discriminant analysis (SZVD). Cardinalities for LARS discriminant vectors are omitted for any data sets for which LARS failed to terminate within 11 days.
